

# Hakluka's Ultimate OSCP Guide: Part 1 — Is OSCP for you? Some things you should know before you start

Luke Stephens (@hakluka)

Feb 15, 2018 · 5 min read ★

If you've landed here, you're probably thinking about taking the Offensive Security PWK course to become an OSCP, but you're not sure if you're quite ready to take the plunge. Well! You've found the right place, my soon-to-be hacker comrade. This is a list of questions that I get asked regularly from people thinking of signing up to the OSCP. I

## How much time do I need?

The #1 misery-generator while sitting your OSCP is not having enough time. Make sure you have at least a few hours every day to focus on learning without distraction. Not only will you have a better chance of passing first go, you will also learn the content more deeply. The more you put into this course, the more you will get out of it.

## How much lab time should I purchase?

A rule of thumb for choosing how much lab time you need:

- If you already a seasoned penetration tester, and you are just getting your OSCP to lengthen your CV and brag to your mum, go with 30 days. Unless you are a super master hacker who doesn't sleep, this probably won't be enough time to own everything in the labs, but you don't need to — you only need to pass the exam.
- If you have a fairly solid foundation in hacking and you have success with other hacking challenges such as [hackthebox.eu](https://hackthebox.eu) or [vulnhub](https://vulnhub.com), go with 60 days.
- If you aren't all that experienced with hacking, or you want to scrape every last drop of information out of the course, go with 90 days.

If it makes you feel any better, your decision is not final — you can always purchase a lab extension after the initial purchase. Also — if you fail your exam, you can resit it for \$60 USD.

## How is the PWK / OSCP structured?

Basically, the course is split into 3 sections:

an effort to gain an extra 5 points in the exam. It was also a good way to hone my documentation skills.

## 2. The Labs

When your lab access starts, you will be granted access to the Offensive Security PWK labs. They consist of a few subnets, and many vulnerable machines. It's your job to own them. Go nuts, try things, experiment and learn.

## 3. The Exam

I'm not sure how much information I'm allowed to give here so I'm going to keep it fairly vague. The exam lasts 23 hours and 45 minutes. During this time you will connect to the exam network where you are provided with a series of vulnerable boxes, similar to the labs, only smaller. It is your job to break into these boxes and document your process.

Once you've completed your exam, you follow the submission guidelines *very carefully* and wait for the (hopefully) good news!

## What's the difference between PWK and OSCP?

PWK stands for "Penetration Testing With Kali Linux", it is the name of the course you take in order to become an OSCP (Offensive Security Certified Professional).

## How do the hackthebox/vulnhub boxes compare to the OSCP labs?

In my experience, challenge sites tend to have a lot of CTF style boxes which are self contained. The vulnerabilities in these boxes could be something you are highly

by “try harder”. The problem is, students can often misinterpret the message. Do not take the message to mean “don’t take breaks”, “don’t go outside”, “don’t learn from others”, “don’t ask for help” or “belittle others”. Different people learn in different ways, and I happen to learn well socially. Chatting with other students was one of my most valuable learning resources, but you have to talk in the right way. Spoilers will not help you learn, topics will, which brings us to our next point.

## How to ask good questions

“Ask topics, not boxes.” That pretty much sums it up. Let’s say you’re attacking a machine called “foo” which is running SMB. Don’t ask “How did you hack foo?”, instead, ask “What are your favourite techniques for enumerating SMB?”. That way, instead of learning how to hack one machine, you have learned the skills to enumerate any SMB service you come accross in future.

## Tips for the exam

- Read every word in this document multiple times: [OSCP Exam Guide](#)
- Take regular breaks
- Plan your time before the exam begins
- Document as you go
- Back up your notes regularly to avoid data loss
- If it seems too complicated, it’s probably not the right path
- Believe in yourself, it’s easy to get overwhelmed
